Project FORESIGHT — Executive Readout

NorthBay Living | Demand & Inventory Intelligence

1. Executive summary

FORESIGHT turns the supplied sales, SKU, calendar and inventory extracts into an 8-week demand forecast and explainable stocking actions. The current run supports 50 SKUs with sales history.

Metric	Current run
Forecast SKUs	50
Reorder now	5
Markdown / clear	7
Healthy	38
Revenue at risk	■2,775,781
Capital locked	■9,334,000
Model WAPE	10.58%
Seasonal-naive WAPE	11.15%

2. Forecast validation

Rolling-origin 8-week backtesting gives a model WAPE of 10.58% versus 11.15% for the seasonal-naive baseline. This comparison is the primary evidence used to decide whether the model earns the right to be used.

3. Actions

Review the reorder list first, validate lead times before ordering, review markdown/clear candidates with merchandising, and leave healthy SKUs under monitoring. The scoring logic is advisory and does not place purchase orders.

4. Data limitations

Inventory contains 200 unique SKUs while the sales/master population contains 50. The 150 inventory-only SKUs are excluded from modelled demand/risk because there is no corresponding sales/master history. The latest inventory snapshot is monthly, so risk is a planning signal rather than real-time inventory control.
